

# NULL literals allowed as operands

Changed in: 2.0

## Description

Before Firebird 2.0, most [operators](#) and predicates did not allow [NULL](#) literals as [operands](#). Tests or operations like `A <> NULL`, `B + NULL` or `NULL < ANY(...)` would be rejected by the parser. Now they are allowed almost everywhere, but please be aware of the following:

*The vast majority of these newly allowed [expressions](#) return `NULL` regardless of the state or value of the other operand, and are therefore worthless for any practical purpose whatsoever.*

In particular, don't try to determine (non-)nullness of a [field](#) or [variable](#) by testing with `= NULL` or `<> NULL`. Always use `IS [NOT] NULL`.

## Predicates

The [IN](#), [ANY/SOME](#) and [ALL](#) predicates now also allow `NULL` literals where they were previously taboo. Here too, there is no practical benefit to enjoy, but the situation is a little more complicated in that predicates with `NULL`s do not always return a `NULL` result. For details, see the [Firebird Null Guide](#), section [Predicates](#).
