ibesConnectionInit

Connects to a database with specified connection parameters.

Syntax

```
 function ibesConnectionInit(AParams : PAnsiChar; AConnectErrorCallbacFunc :
TConnectErrorCallbackFunc) : THandle;
```

AParams is a string with connection params. Syntax of the params string is the same as the Connect function: IBEScript.dll documentation.

AConnectErrorCallbacFunc is a pointer to a callback function which will be fired in case of a connection error.

ibesConnectionInit returns a connection object handle (if successful) which should be used as an argument with the ibesScriptSetConnection function.

All IBEScript.dll interface & callback functions provide ABlockName argument which contains the name of the block if execution of that block was initiated as below:

```
EXECUTE IBEBLOCK MYBLOCK ...
```

If block name is missing ABlockName parameter will contain an empty string.
