

Exception

Exceptions are user-defined named error messages, written specifically for a [database](#) and stored in that database for use in [stored procedures](#) and [triggers](#).

If it is ascertained in a trigger that the value in a [table](#) is incorrect, the exception is fired. This leads to a [rollback](#) of the total [transaction](#) that the client application is attempting to commit. Exceptions can be interleaved.

They can be shared among the different modules of an [application](#), and even among different applications sharing a database. They provide a simple way to standardize the handling of preprogrammed input errors. Exceptions are typically used to implement program logic, for example, you do not wish a user to sell an item in stock, which has already been reserved by another user for their customer.

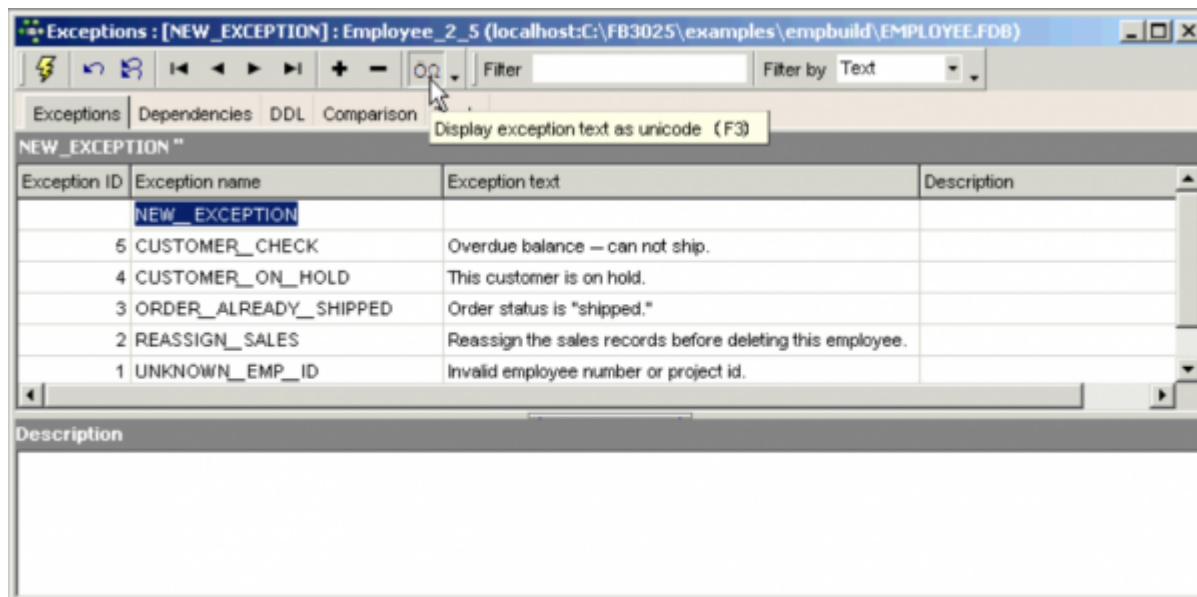

Exceptions are [database objects](#) and are part of the database's [metadata](#), and can be created, modified and dropped as all other Firebird/InterBase® objects in the IBE expert [DB Explorer](#).

The maximum size of an exception message was raised in Firebird 2.0 from 78 to 1021 bytes.

New exception/Exception Editor

A new exception can be created in a connected database either by using the menu item Database / New Exception, the respective icon in the [New Database Object toolbar](#), or using the [DB Explorer](#) right-click menu (or key combination [Ctrl + N]), when the exception heading of the relevant connected database is highlighted. A *New Exception* dialog appears, with its own toolbar:

Exception messages can be displayed as Unicode (UTF8) and UTF8 is also supported for descriptions and the [DDL page](#). Exception messages are converted to URF8 to avoid the *malformed string* error.

Alternatively, a new exception can be created directly in the IBExpert [SQL Editor](#), using the following statement:

```
CREATE EXCEPTION <Exception_Name>
"Exception_Text";
```

The *Exception Editor* can be opened directly from the [DB Explorer](#) by double-clicking on any existing exception name. It can also be started directly from any procedure or trigger containing an exception, simply by double-clicking on the exception name in the SQL text on the Procedure Editor's [Edit](#) page, or the Trigger Editor's [Triggers](#) page.

Exceptions page

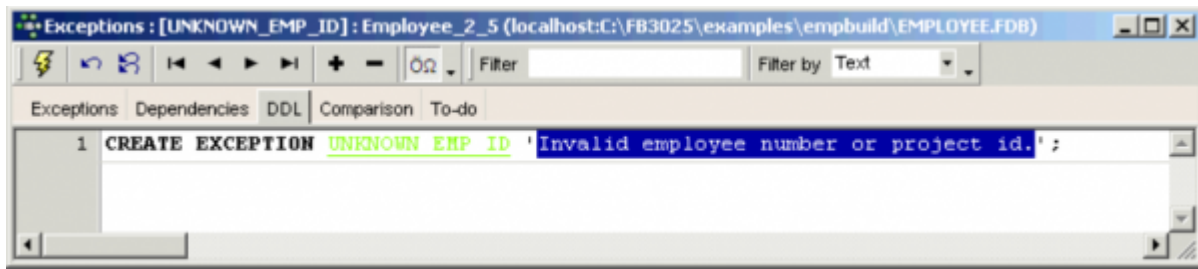

The new exception name can be added to the list displaying all exceptions for the active database, and the exception text message entered. Please be careful when using special characters! Especially when using older versions of InterBase®, it is preferable to abstain from using any special characters. With the newer versions, there should not be any problems, provided the correct character set has been specified. The exception ID is automatically assigned by the database, when the exception is committed.

After creating the exception, it then needs to be incorporated into a stored procedure or a trigger, to determine under what conditions and when the exception is to appear. Please refer to [Raising an Exception](#) for details.

Dependencies

Please refer to [Table Editor / Dependencies](#).

DDL

Please refer to [Table Editor / DDL](#).

Comparison

Please refer to [Table Editor / Comparison](#).

To-Do

Please refer to [Table Editor / To-Do](#).

Raising an exception

The `EXCEPTION` statement is used to notify a calling application of an exception. The calling application can be a [trigger](#), a [stored procedure](#), or another program. To raise an exception in a trigger or stored procedure use the `EXCEPTION` keyword:

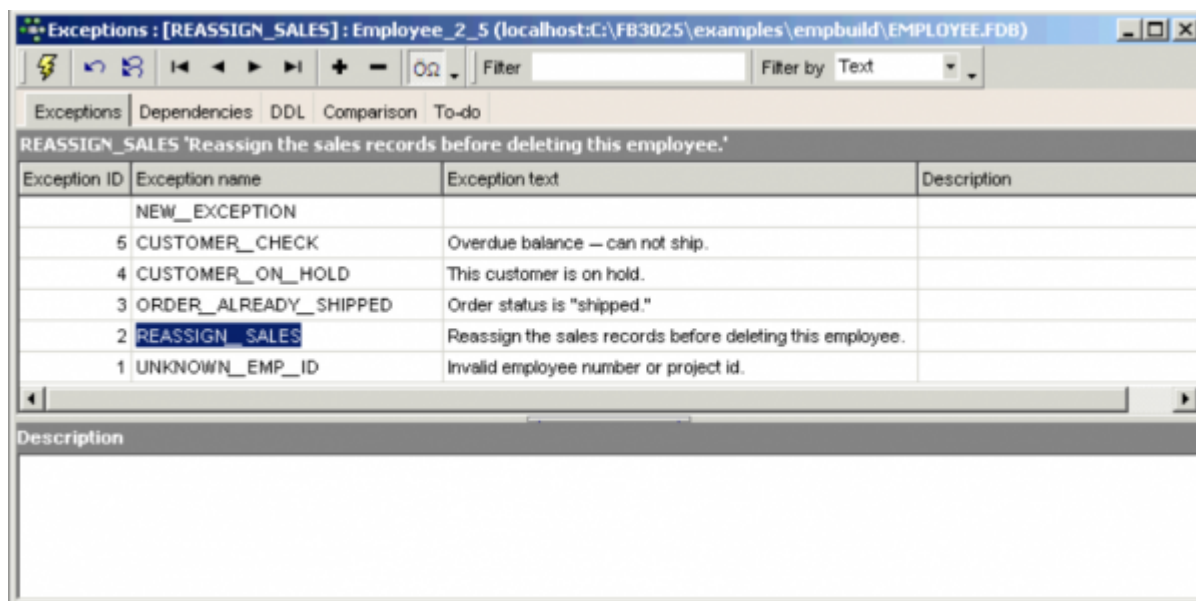

```
EXCEPTION <Exception_Name>;
```

When an exception is raised, the following takes place:

1. The exception terminates the trigger or procedure.
2. Any statements in the trigger or stored procedure that follow the `EXCEPTION` statement are not executed. In the case of a `BEFORE` trigger the update that fired the trigger is aborted.
3. The trigger or procedure returns an error message to the calling application.

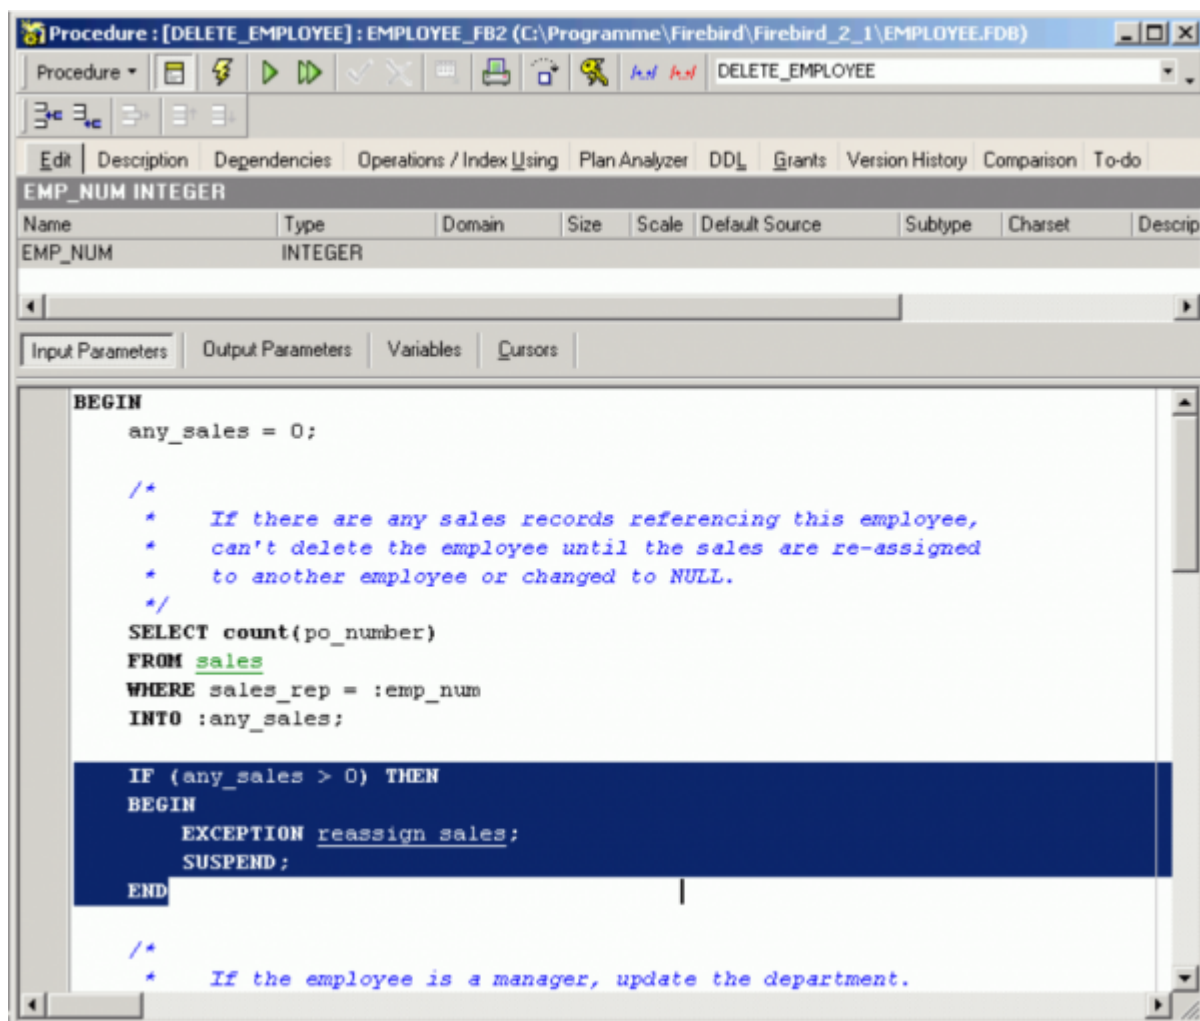

Exceptions may be trapped and handled with a `WHEN` statement in a stored procedure or trigger.

An example of an exception raised in a procedure can be found in the `EMPLOYEE` database. The exception `REASSIGN_SALES` was first created:

Exception ID	Exception name	Exception text	Description
	NEW_EXCEPTION		
5	CUSTOMER_CHECK	Overdue balance — can not ship.	
4	CUSTOMER_ON_HOLD	This customer is on hold.	
3	ORDER_ALREADY_SHIPPED	Order status is "shipped."	
2	REASSIGN_SALES	Reassign the sales records before deleting this employee.	
1	UNKNOWN_EMP_ID	Invalid employee number or project id.	

and then incorporated into the `DELETE_EMPLOYEE` procedure:

```
BEGIN
    any_sales = 0;

    /*
     *   If there are any sales records referencing this employee,
     *   can't delete the employee until the sales are re-assigned
     *   to another employee or changed to NULL.
     */
    SELECT count(po_number)
    FROM sales
    WHERE sales_rep = :emp_num
    INTO :any_sales;

    IF (any_sales > 0) THEN
    BEGIN
        EXCEPTION reassign sales;
        SUSPEND;
    END

    /*
     *   If the employee is a manager, update the department.
     */
```

[back to top of page](#)

Edit exception/alter exception

Exceptions can be altered directly in the *Exceptions Editor*, started by double-clicking directly on the exception name in the [DB Explorer](#). Alternatively use the DB Explorer's right mouse-click menu item Edit Exception or key combination [Ctrl + O].

The [Exception Editor](#) appears, where changes to the exception name and exception text can be made as wished. Changes to exception texts may be made even if other objects depend on them, however not the exception name.

The SQL syntax is:

```
ALTER EXCEPTION <exception_name>  
'New Exception Text';
```

An exception can be altered by its creator, the SYSDBA user, and any users with operating system root privileges.

A number of new syntaxes for changing exceptions was introduced in Firebird 2.0. Please refer to [Firebird 2.0.4 Release Notes: New syntaxes for changing exceptions](#) for further information.

[back to top of page](#)

Create or alter exception

Introduced in Firebird 2.0, `CREATE OR ALTER EXCEPTION` will create the exception if it does not already exist, or will alter the definition if it does, without affecting dependencies.

See also:

[CREATE OR ALTER EXCEPTION](#)

Recreate exception

New to Firebird 2.0: The DDL statement [RECREATE EXCEPTION](#) is now available in DDL. Semantics are the same as for other RECREATE statements.

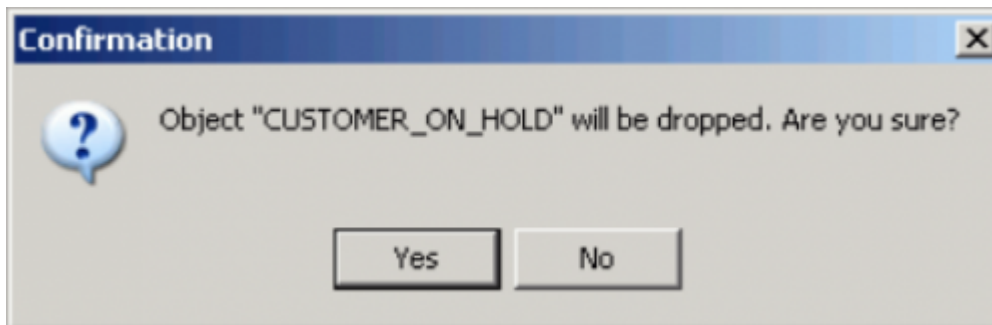

See also:

[RECREATE EXCEPTION](#)

Drop exception/delete exception

An exception may not be dropped if it is used by other procedures or triggers, until the dependency is removed. Any such dependencies are listed on the Exception Editor's Dependencies page, where they can be directly removed, if wished.

To drop an exception use the [DB Explorer](#) right mouse-click menu item *Drop Exception...* or [Ctrl + Del]. IBExpert asks for confirmation:

before finally dropping the exception. Once dropped, it cannot be retrieved.

Using SQL the syntax is:

```
DROP EXCEPTION <exception_name>;
```

An exception can only be dropped by its creator, the database owner, SYSDBA, and any users with operating system root privileges.
