

OLE (Object Linking and Embedding)

OLE is an abbreviation of Object Linking and Embedding, pronounced as separate letters or as oh-leh. OLE is a compound document standard developed by the Microsoft Corporation. It enables you to create objects with one [application](#) and then link or embed them in a second application. Embedded objects retain their original format and links to the application that created them.

Support for OLE is built into the Windows and Macintosh operating systems. A competing compound document standard developed jointly by IBM, Apple Computer, and other computer firms is called OpenDoc.
